#### The Inverse Z-Transform

## **Scope and Background Reading**

This session we will talk about the Inverse Z-Transform and illustrate its use through an examples class.

The material in this presentation and notes is based on Chapter 9 (Starting at Section 9.6) of <u>Steven T. Karris</u>, <u>Signals and Systems</u>: <u>with Matlab Computation and Simulink Modelling</u>, <u>5th Edition</u>. (<a href="http://site.ebrary.com/lib/swansea/docDetail.action?docID=10547416">http://site.ebrary.com/lib/swansea/docDetail.action?docID=10547416</a>) from the **Required Reading List**.

## **Agenda**

- Inverse Z-Transform
- · Examples using PFE
- Examples using Long Division
- · Analysis in Matlab

#### The Inverse Z-Transform

The inverse Z-Transform enables us to extract a sequence f[n] from F(z). It can be found by any of the following methods:

- · Partial fraction expansion
- The inversion integral
- · Long division of polynomials

#### **Partial fraction expansion**

We expand F(z) into a summation of terms whose inverse is know. These terms have the form:

$$k, \frac{r_1 z}{z - p_1}, \frac{r_1 z}{(z - p_1)^2}, \frac{r_3 z}{z - p_2}, \dots$$

where k is a constant, and  $r_i$  and  $p_i$  represent the residues and poles respectively, and can be real or complex<sup>1</sup>

#### **Notes**

1. If complex, the poles and residues will be in complex conjugate pairs

$$\frac{r_i z}{z - p_i} + \frac{r_i^* z}{z - p_i^*}$$

#### **Step 1: Make Fractions Proper**

- Before we expand F(z) into partial fraction expansions, we must first express it as a *proper* rational function.
- This is done by expanding F(z)/z instead of F(z)
- · That is we expand

$$\frac{F(z)}{z} = \frac{k}{z} + \frac{r_1}{z - p_1} + \frac{r_2}{z - p_2} + \cdots$$

#### Step 2: Find residues

· Find residues from

$$r_k = \lim_{z \to p_k} (z - p_k) \frac{F(z)}{z} = (z - p_k) \frac{F(z)}{z} \Big|_{z = p_k}$$

#### Step 3: Map back to transform tables form

• Rewrite F(z)/z:

$$z\frac{F(z)}{z} = F(z) = k + \frac{r_1 z}{s - p_1} + \frac{r_2 z}{s - p_2} + \cdots$$

### **Example 1**

Karris Example 9.4: use the partial fraction expansion to compute the inverse z-transform of

$$F(z) = \frac{1}{(1 - 0.5z^{-1})(1 - 0.75z^{-1})(1 - z^{-1})}$$

# **Answer to Example 1**

$$f[n] = 2\left(\frac{1}{2}\right)^n - 9\left(\frac{3}{4}\right)^n + 8$$

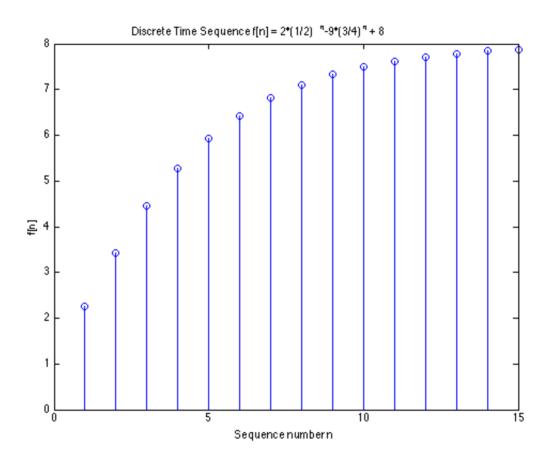

#### **Matlab solution**

See example1.m (matlab/example1.m)

Uses Matlab functions:

- collect expands a polynomial
- sym2poly converts a polynomial into a numeric polymial (vector of coefficients in descending order of exponents)
- residue calculates poles and zeros of a polynomial
- ztrans symbolic z-transform
- iztrans symbolic inverse ze-transform
- stem plots sequence as a "lollipop" diagram

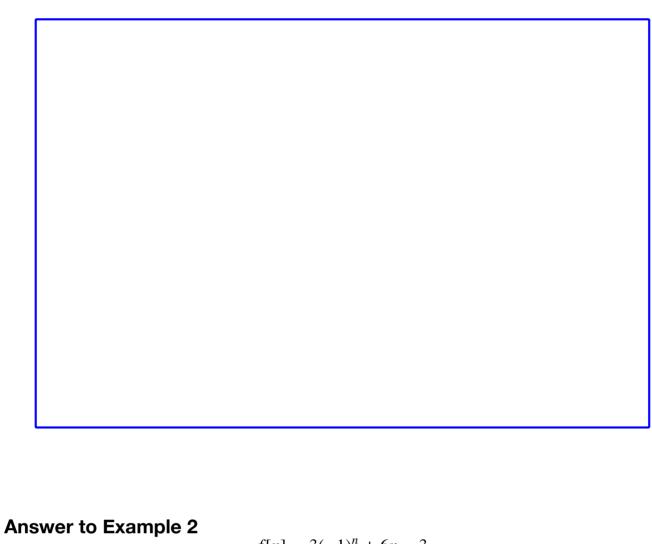

## Stem ("Lollipop") Plot

### **Example 2**

Karris example 9.5: use the partial fraction expansion method to to compute the inverse z-transform of

$$F(z) = \frac{12z}{(z+1)(z-1)^2}$$

$$f[n] = 3(-1)^n + 6n - 3$$

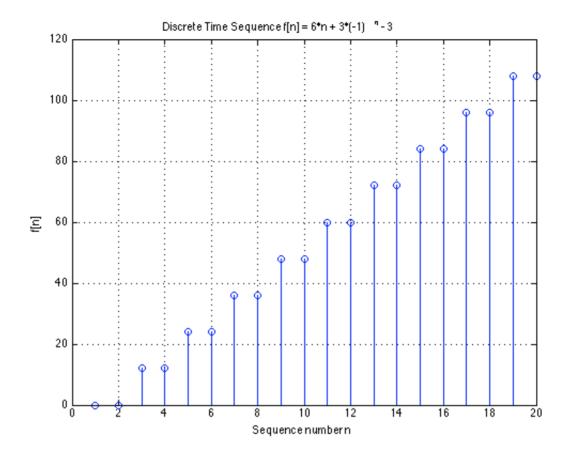

#### **Matlab solution**

See example2.m (matlab/example2.m)

Uses additional Matlab functions:

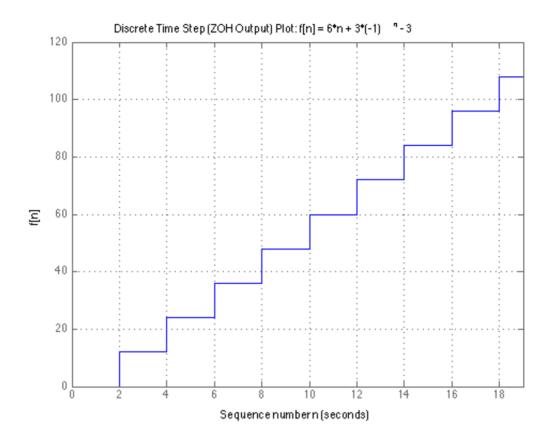

-  $\operatorname{dimpulse}$  - computes and plots a sequence f[n] for any range of values of n

# **Lollipop Plot**

#### **Staircase Plot**

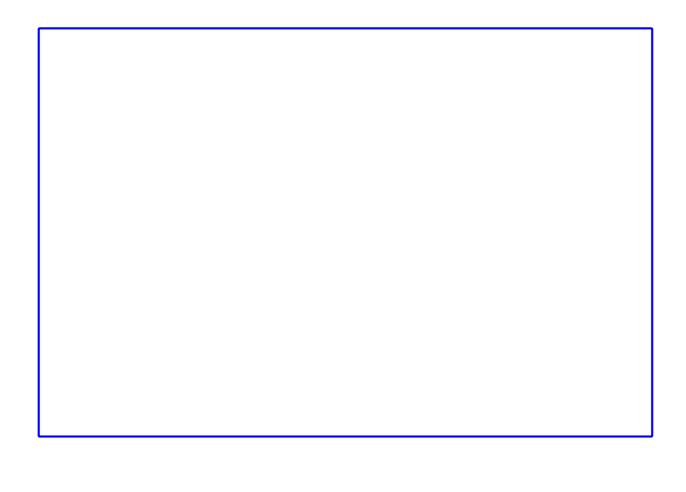

Simulates output of Zero-Order-Hold (ZOH) or Digital Analogue Converter (DAC)

## Example 3

Karris example 9.6: use the partial fraction expansion method to to compute the inverse z-transform of

$$F(z) = \frac{z+1}{(z-1)(z^2+2z+2)}$$

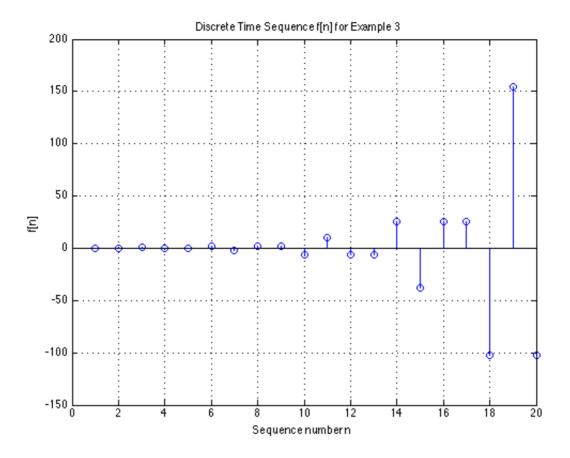

Answer to Example 3
$$f[n] = -0.5\delta[n] + 0.4 + \frac{(\sqrt{2})^n}{10}\cos\frac{3n\pi}{4} - \frac{3(\sqrt{2})^n}{10}\sin\frac{3n\pi}{4}$$

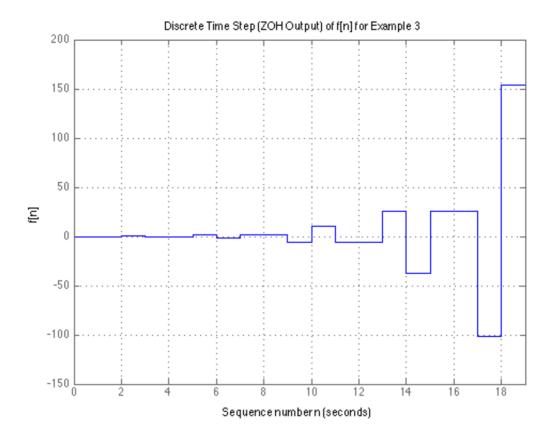

#### **Matlab solution**

See example3.m (matlab/example3.m)

# **Lollipop Plot**

## **Staircase Plot**

#### **Inverse Z-Transform by the Inversion Integral**

The inversion integral states that:

$$f[n] = \frac{1}{j2\pi} \oint_C F(z) z^{n-1} dz$$

where C is a closed curve that encloses all poles of the integrant.

This can (apparently) be solved by Cauchy's residue theorem!!

Fortunately (:-), this is beyond the scope of this module!

See Karris Section 9.6.2 (pp 9-29-9-33) if you want to find out more.

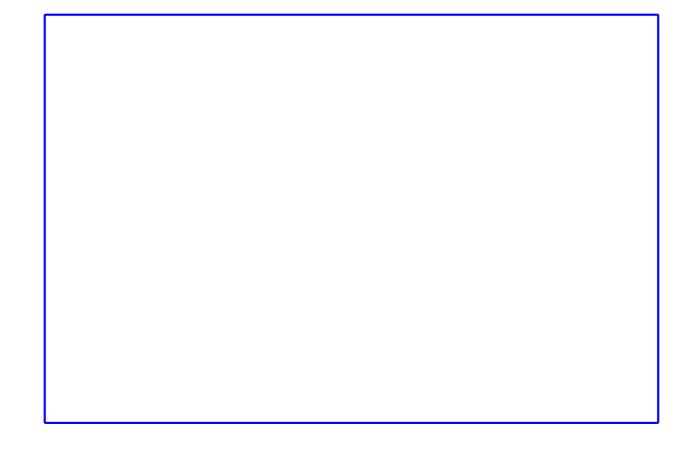

#### **Inverse Z-Transform by the Long Division**

To apply this method, F(z) must be a rational polynomial function, and the numerator and denominator must be polynomials arranged in descending powers of z.

#### **Example 4**

Karris example 9.9: use the long division method to determine f[n] for n = 0, 1, and 2, given that

$$F(z) = \frac{1 + z^{-1} + 2z^{-2} + 3z^{-3}}{(1 - 0.25z^{-1})(1 - 0.5z^{-1})(1 - 0.75z^{-1})}$$

#### **Answer 4**

$$f[0] = 1, f[1] = 5/2, f[2] = 81/16, \dots$$

## Matlab

See example4.m (matlab/example4.m)

$$sym_den = z^3 - (3*z^2)/2 + (11*z)/16 - 3/32$$

fn =

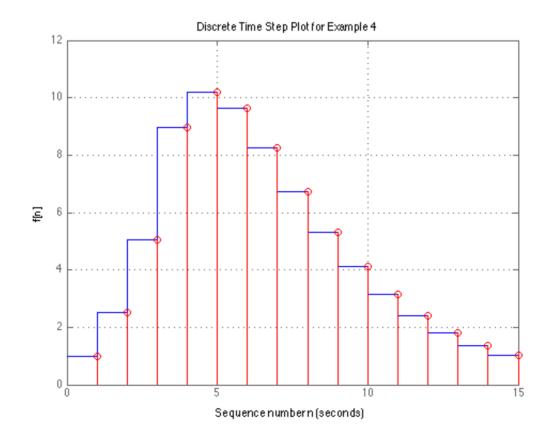

1.0000

2.5000

5.0625

. . . .

## **Combined Staircase/Lollipop Plot**

## **Methods of Evaluation of the Inverse Z-Transform**

Method	Advantages	Disadvantages
Partial Fraction Expansion	<ul><li>Most familiar.</li><li>Can use Matlab `residue` function.</li></ul>	• Requires that $F(z)$ is a proper rational function.
Invsersion Integral	• Can be used whether $F(z)$ is rational or not	Requires familiarity with the     *Residues theorem* of complex     variable analaysis.
Long Division	<ul> <li>Practical when only a small sequence of numbers is desired.</li> <li>Useful when z-transform has no closed-form solution.</li> <li>Can use Matlab `dimpulse` function to compute a large</li> </ul>	<ul> <li>Requires that F(z) is a proper rational function.</li> <li>Division may be endless.</li> </ul>

## **Summary**

- Inverse Z-Transform
- Examples using PFE
- Examples using Long Division
- Analysis in Matlab
